
Built Together Funding

Master Project Summary

Read this first instead of proofing every PDF.

Plain-English map of the brand, funnel, tech, Cursor build, and launch priorities.

Core idea

Capital for service businesses - only when it increases profit.

The website is not just a site. It is a pre-qualification and lead-generation machine.

Status: Context folder is organized. Missing-context pack exists. Master Cursor prompt is ready.

Next move: Open the project in Cursor, paste the master prompt, and force Cursor to do Phase 1 first.

Main risk: Building a good-looking homepage but skipping lead scoring, compliance, CRM, tracking, and automations.

1. The whole project in one page

Use this as the dashboard for what is happening.

You are building **Built Together Funding Corp** as a premium, operator-led funding and growth brand for service and trade businesses. The goal is not to build a generic MCA website. The goal is to build a website plus application funnel that filters serious operators, captures high-quality leads, and routes them into a funding review call.

Core message: Built Together Funding helps service businesses scale capacity using capital - only when it actually increases profit.

What it is • A premium funding/growth partner for real service businesses. • A mobile-first website with a strong CTA and application funnel. • A lead-intake system with scoring, CRM fields, notifications, and tracking. • A brand built around capacity, crews, equipment, trucks, and growth.	What it is not • Not a cheap cash-advance landing page. • Not a generic bank-looking site. • Not a promise of guaranteed approvals. • Not for startups, beginners, or businesses with no demand.
---	---

The site has to do three jobs at once

1. **Position the brand** - make serious contractors feel like this company understands scaling because it comes from real operator experience.
2. **Filter leads** - use the application to separate real operators from low-quality borrowers before any call happens.
3. **Create a system** - save leads, score them, send notifications, track source data, and prepare follow-up so the business can scale.

Current project status: You organized the /context folder, added the 08-missing-context folder, and now have a final master prompt ready for Cursor. Next, Cursor should read the context first and create CONTEXT-INDEX.md before coding.

2. What each context folder is for

You do not need to read every file. This is the simple map.

Folder	What it tells Cursor	Why it matters
01-brand	Brand kit, colors, typography, logo direction, visual feel.	Keeps the site from becoming a generic finance site.
02-strategy	Positioning, lead flow, paid/organic strategy, target customer.	Tells Cursor what kind of business system it is building.
03-site-references	Reference-site analysis instructions and conversion mechanics.	Guides CTA placement and funnel structure without copying.
04-stack	Next.js/Vercel/Supabase/Resend/Twilio build pattern.	Keeps the code aligned with your Wash Kings-style stack.
05-compliance	Compliance drafts/placeholders when added.	Prevents risky funding language and missing legal pages.
06-funnel	Application questions, scoring rules, SMS/email follow-up.	Turns the site into a pre-qualification system.
07-content	Homepage copy, FAQ, founder story, industry pages.	Feeds the site copy and SEO pages.
08-missing-context	The rules I added: compliance, scoring, CRM, tracking, automations, QA.	This is what stops Cursor from building only a pretty homepage.

Cursor instruction: Tell Cursor to read everything inside C:\Users\Asus\BTF CORP\context before coding. Then tell it: **Start Phase 1 only. Create CONTEXT-INDEX.md first. Do not build the site yet.**

3. Brand rules Cursor must obey

This is the look, feel, and language standard.

Brand personality • Operator-led and real. • Premium, modern, and selective. • Rugged but refined. • Contractor-focused, not finance-bro generic. • High-trust and high-conviction.	Brand promise • We understand scaling because we have done it. • Capital is used for capacity, not desperation. • Funding only makes sense when it helps the business make more money. • The business must already have demand or a clear growth path.
--	---

Visual direction

The design should feel like **Apple x Blue Collar x Modern Fintech**. Think dark, premium, sharp, smooth, fast, and contractor-focused. The original electric blue direction stays; it gets modernized, not replaced.

Item	Rule
Backgrounds	#0A0A0A, #121212, #1A1A1A, with dark support colors.
Accent blue	#35C2FF, #4FBFFF, #6FD3FF for CTAs, glows, progress, icons, and funnel states.
Typography	Bold, clean, premium. Inter Tight / Satoshi / General Sans direction.
Logo	Keep hammer/wrench/trades idea, but clean it into a modern flat vector style.
UX	Mobile-first, fast, direct, conversion-focused, with minimal distractions.

Language rule: Use direct, confident, operator-led copy. Avoid generic finance fluff, instant approval language, fake urgency, fake testimonials, and anything that sounds desperate or spammy.

4. Website structure

The pages and homepage sections Cursor should build.

The site should be built like a conversion system. Every page should push visitors toward the application while also educating them enough to trust the brand.

Page	Purpose
/	Homepage: primary conversion page.
/apply	Interactive application and pre-qualification funnel.
/how-it-works	Explains process from apply to review call to funding options.
/who-we-help	Filters by industry and maturity level.
/funding-uses	Explains equipment, crews, trucks, marketing, and capacity use cases.
/about	Founder/operator story and philosophy.
/resources	SEO/blog hub for scaling service businesses.
/contact	Contact and call CTA.
/privacy-policy, /terms, /disclosures	Legal/compliance pages.

Homepage section order

- Hero with strong headline, subheadline, and primary CTA: **See If You Qualify**.
- Operator-led positioning and founder credibility.
- Who we help; who this is not for; what funding should be used for.
- Interactive application preview.
- Process: Apply - Pre-screen - Review call - Options - Deploy capital.
- Founder/operator story, trust/authority section, FAQ, and final CTA.

5. Application funnel

This is the real product inside the website.

The application should feel like an interactive module, not a boring funding form. It should guide users step-by-step, show progress, and create a serious operator screening feeling.

What the funnel collects • Owner name, business name, phone, email. • Industry and website/social link. • Monthly/annual revenue and time in business. • Funding amount and intended use. • Capacity constraint, booked-out status, turning down work. • Equipment, hiring, ad spend, active advances, bank statements. • Best contact time and SMS/email consent.	What the funnel decides • Does this business already operate? • Does demand already exist? • Is funding tied to growth/capacity? • Is this a strong fit, manual review, or not ready yet? • How should the follow-up call be positioned?
---	---

Critical wording: Never show **approved** on the result screen. Use: **Your business may be a fit for a funding review.** Or: **Based on your answers, you may qualify for a funding strategy call.** Always say this is not funding approval.

Result logic

Result	When it happens	User-facing meaning
Prequalified	Revenue, time in business, and growth use case are strong.	May qualify for a funding review call.
Needs review	Some signals are good but details are incomplete or riskier.	Team will review manually.
Not fit yet	Startup, weak revenue, unclear use, no demand, survival funding.	Not the right fit yet, but not insulted or harshly denied.

6. Backend system

What makes this more than a homepage.

Cursor needs to build the backend around the lead funnel. The system should save lead data, score the lead, notify the team, confirm the applicant, and capture tracking data.

Supabase lead record • Contact info and business info. • Revenue, time in business, funding amount, use of funds. • Capacity constraint answers. • Lead score and lead status. • UTM/source tracking. • Raw answers as JSONB. • Notes and admin-ready fields.	Lead statuses • new • prequalified • needs_review • not_fit • contacted • call_booked • submitted_to_partner • funded • lost
--	---

After a user submits

1. **Validate** - use Zod to check required fields and prevent bad data.
2. **Score** - run the lead through the pre-qualification logic.
3. **Save** - insert the lead into Supabase with source and UTM data.
4. **Notify** - send internal email/SMS if Resend/Twilio are configured.
5. **Confirm** - send applicant email/SMS confirmation only with proper consent.

7. Automations, tracking, and follow-up

This is what makes paid ads measurable.

Paid ads are the primary lead driver, so tracking cannot be an afterthought. The site needs to know where a lead came from and what actions happened before submission.

Track these events • CTA clicks • Phone clicks • Form started • Application completed • Prequalified result • Manual review result • Not-fit result • Landing page path	Capture these fields • utm_source • utm_medium • utm_campaign • utm_content • utm_term • source • landing_page • conversion result
--	---

Automation message: Applicant confirmation should say the business may be a fit for a funding review, that the team will reach out, and that this is not a funding approval. Internal notifications should include all lead details, score, status, use of funds, and UTM source/campaign.

Integrations to prepare

- Supabase for lead storage; Resend for email notifications; Twilio for SMS notifications.
- GA4, Google Ads conversion, and Meta Pixel placeholder hooks.
- Environment variables in `.env.local.example` and Vercel project settings.

8. Compliance and risk guardrails

This page matters before paid ads go live.

Plain-English rule: The website can pre-qualify a lead for a funding review call. It must not imply actual funding approval, guaranteed terms, guaranteed rates, guaranteed savings, or guaranteed profit increases.

Required pages • Privacy Policy • Terms of Use • Funding Disclosures • Contact page with clear business info • SMS/email consent language • Opt-out language for SMS	Required disclaimers • Pre-qualification is not funding approval. • Funding options are subject to review and underwriting. • Partner availability may vary. • No guaranteed approval, terms, rates, savings, or profit. • Applicant information may be used to contact them about options.
---	--

Copy to avoid

- Instant approval; guaranteed funding; no documents required; bad credit okay.
- Get cash fast; approved in minutes; we guarantee profit; every business qualifies.

Important: The legal pages Cursor creates should be treated as placeholders. Before running real ads or collecting real funding leads at scale, have an attorney review the final site copy, disclosures, SMS consent, privacy policy, and terms.

9. Cursor build plan

Do not let Cursor skip the thinking stage.

The most important instruction is to force Cursor to read the context and make a `CONTEXT-INDEX.md` before it codes. That file becomes the project brain.

Phase	What Cursor should do	Owner check
1	Read <code>/context</code> and create <code>CONTEXT-INDEX.md</code> .	Does it understand the brand, funnel, stack, and compliance?
2	Scaffold Next.js project and configs.	Does it match the Wash Kings-style stack?
3	Build design system, nav, footer, buttons, cards, disclaimers.	Does it feel premium/dark/blue/operator-led?
4	Build homepage.	Does it sell the idea clearly and push to <code>/apply</code> ?
5	Build supporting pages.	Do pages filter and educate leads?
6	Build <code>/apply</code> application funnel.	Does it feel interactive and avoid approval language?
7	Build backend, scoring, Supabase, Resend, Twilio.	Does it save and notify correctly?
8	Build legal pages and disclaimers.	Are compliance warnings visible?
9	Add tracking hooks and UTM capture.	Can ads be measured?
10	Run lint/build and fix errors.	Can it deploy?

10. What Jeremiah needs to review

You do not need to proof every PDF line-by-line.

Your job is to make sure the final build matches the business strategy, not to inspect every technical detail Cursor writes. Use this page as your proofing checklist.

Review personally • Does the homepage feel premium and trustworthy? • Does the founder story sound real, not corny? • Does the site clearly filter out beginners/startups? • Does the blue/dark brand feel like Built Together Funding? • Does the application ask the right questions? • Does the result screen avoid approval language? • Would a real contractor feel: these guys understand my business?	Do not get stuck on • Tiny code details Cursor can fix later. • Whether every paragraph matches the PDFs exactly. • Perfect admin dashboard in version 1. • Blog automation on day one. • Over-designing before the funnel works. • Adding fake proof just to make it look bigger.
---	---

Assets still needed from you

- Final logo or logo references; founder photo or professional image direction.
- Any legally usable proof from prior funding experience.
- Wash Kings/operator photos you want to use as brand proof.
- Business phone/email/domain choices.
- Exact funding partner/process details, if you want them displayed.
- Attorney-reviewed legal language before paid launch.

Simple success test: If a roofer, exterior cleaner, landscaper, or contractor doing real revenue lands on the site and thinks, “these guys understand scaling a service business,” the brand direction is working.

11. Immediate next steps

Do these in order.

1. **Open Cursor in the project root.** Open `C:\Users\Asus\BTF CORP`, not just the `/context` folder.
2. **Paste the master prompt.** Use the final master prompt we created, with the local context path included.
3. **Force Phase 1 only.** Tell Cursor: Start Phase 1 only. Read `/context` and create `CONTEXT-INDEX.md` first. Do not code yet.
4. **Review `CONTEXT-INDEX.md`.** Make sure Cursor understood the brand, funnel, stack, compliance, scoring, and pages.
5. **Then allow coding phase by phase.** Do not let Cursor build everything in one messy pass. Approve each phase.
6. **Test after each major phase.** Run dev, lint, build, check mobile view, and check application behavior.

Bottom line: You are ready to start. The context folder now has the brand, strategy, stack, site-reference, and missing implementation rules. The job now is to make Cursor read the context first, then build the site as a complete lead-generation system.

Source files summarized: brand kit, strategy/system PDFs, site-reference prompt, Wash Kings stack handoff, missing-context PDF, and final master Cursor prompt. This summary is a project control document, not a legal review.
